To be effective, a drug must be administered in the form of the pure enantiomer, since only one enantiomer has the desired therapeutic or toxic effect. Moreover, in the event that an undesirable side-effect is associated with a particular enantiomer, it is important that the other enantiomer not be present in the drug product. A chiral molecule may exist in an achiral form or as two stereoisomers. The so-called mirror image (enantiomers) of the same chiral molecule are isomers and do not have identical properties. In general, one enantiomer has one kind of biological activity and the other enantiomer has an opposite biological activity. If the biologically active form of the compound could be selected by modifying the synthesis, this would offer substantial benefits. A pair of stereoisomers can be separated by special techniques, such as chromatography. Depending on the chromatographic conditions, one enantiomer may preferentially separate from the other enantiomer. This is the case in solid-phase chiral chromatography, in which a chiral stationary phase is used. This technique involves immobilizing a chiral molecule on a solid support, typically a polymeric matrix. Enantiomerically enriched chiral molecules can be produced by fermentation. However, this technique is limited to microorganisms which naturally produce such compounds, and only a limited number of compounds can be produced at one time. Thus, the technique is not suitable for the large-scale production of enantiomerically pure compounds.

Field of the Invention The present invention relates to a thin film transistor and an active matrix display device having the thin film transistor. 2. Description of the Related Art In recent years, demand for portable information apparatuses (e.g., a personal computer, a smartphone, and a mobile phone) has been increasing rapidly. Therefore, thin film transistors (TFTs) to be used in portable information apparatuses need to be high in both device operation speed and durability. As a TFT substrate that is to be used in a device of a portable information apparatus such as a mobile phone, a liquid crystal display device, and the like, an active matrix liquid crystal display device, an organic EL (Electro Luminescence) display device, and the like are known. As a driving method of the active matrix liquid crystal display device, a method using an amorphous silicon TFT is well known. However, since the amorphous silicon TFT has low field effect mobility, when an attempt is made to increase the response speed, the frequency of a video signal needs to be increased. However, in this case, the power consumption becomes high. As a TFT that can solve this problem, a TFT in which a poly
